

Unique Characters

Problem ID: uniquecharacters

Write a program that checks if a string has all unique characters. A string contains all unique characters if no character appears more than once.

Note: You may *not* use built-in set operations or hash-based uniqueness checking functions.

Input

The input consists of multiple lines:

- The first line contains an integer t ($1 \leq t \leq 100$), the number of test cases.
- Each of the next t lines contains a string s ($1 \leq |s| \leq 100$), containing only lowercase letters.

Output

For each test case, output `True` if all characters in the string are unique, otherwise output `False`.

Constraints

- Time Limit: 1 second
- Memory Limit: 256 MB

Sample

Sample Input 1	Sample Output 1
2 abcdefg hello	True False
